W3C Document Formats domain

The Extensible Stylesheet Language (XSL)

XSL is a language for expressing stylesheets. It consists of three parts: [XSL Transformations \(XSLT\)](#): a language for transforming XML documents, the [XML Path Language \(XPath\)](#), an expression language used by XSLT to access or refer to parts of an XML document. (XPath is also used by the [XML Linking](#) specification). The third part is XSL Formatting Objects: an XML vocabulary for specifying formatting semantics. An XSL stylesheet specifies the presentation of a class of XML documents by describing how an instance of the class is transformed into an XML document that uses the formatting vocabulary. For a more detailed explanation of how XSL works, see the [What Is XSL](#) page.

For background information on style sheets, see the [Web style sheets](#) resource page. XSL is developed by the W3C [XSL Working Group \(members only\)](#) whose [charter](#) is to develop the next version of XSL. XSL is part of W3C's [Style Activity](#), whose work is described in the [Style Activity Statement](#).
